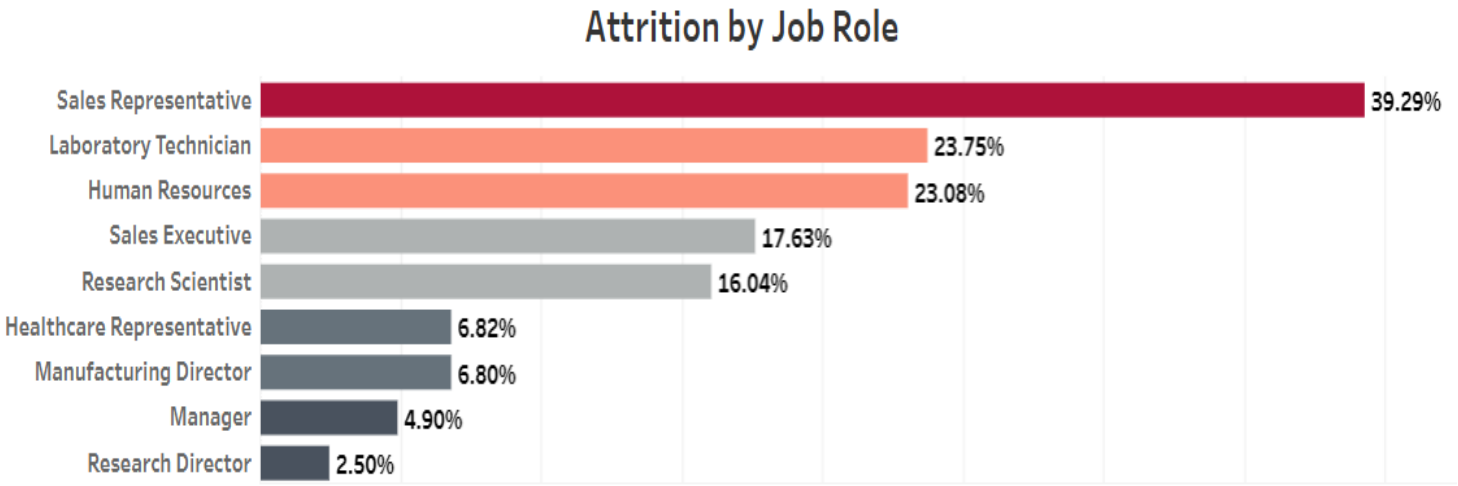
HR Report



1- Investigate Attrition, does job role affect attrition?

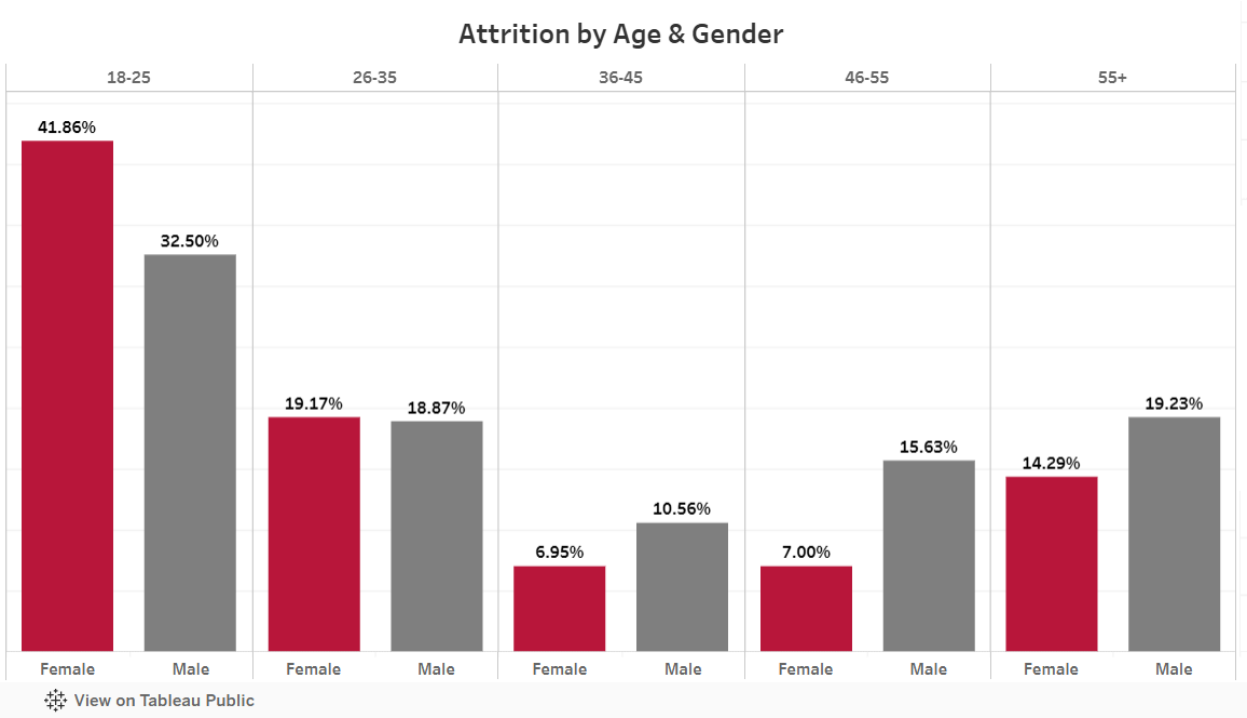
Yes, job role significantly affects attrition.

- **Highest attrition:**

  Sales Representatives have the highest attrition rate at 39.29%, this usually points to issues like high pressure, commission-based stress, workload instability, or better external opportunities. It means the company is losing talent mainly from frontline revenue roles, followed by Laboratory Technicians (23.75%) and HR staff (23.08%), suggesting possible problems with career growth, compensation, or job satisfaction in support/operational roles.

- **Lowest attrition:**

  Research Directors have the lowest rate at only 2.50%, which typically indicates high job stability, stronger compensation, clearer career progression, and higher organizational commitment at senior levels.



2- Which age groups and gender have the highest attrition rates?

Early Career Crisis (18–25)

This is a structural failure in onboarding and early retention.

- **Attrition above 30% for both genders means the company is failing to retain new hires.**
- **The female spike (41.86%) is a red flag, not a normal variation. It suggests:**
  - **Poor early career support or mentorship for women**
  - **Possible culture mismatch or lack of inclusion**
  - **Pay, role expectations, or growth misalignment hitting women harder**

The company is heavily leaking entry-level talent, this is the most critical retention problem.

Prime Years Stability (26–55)

This is where the company operates efficiently.

- **Attrition drops significantly → employees are settled, experienced, and invested.**
- **Females show stronger retention than males across most of this range.**
- **Male attrition being higher suggests:**
  - **Men are more likely to switch jobs for better pay/opportunities**
  - **External market pull is stronger for experienced male employees**

Mid-career retention is relatively healthy, but male turnover indicates competitive pressure from the job market.

Late Career Pivot (55+)

This is not a "problem" — it's expected behavior.

- **The increase is driven by:**
  - **Retirement decisions**
  - **Transition to consulting/freelance**
- **Male spike higher than female suggests:**
  - **Earlier retirement patterns among men**
  - **Financial readiness or role saturation**

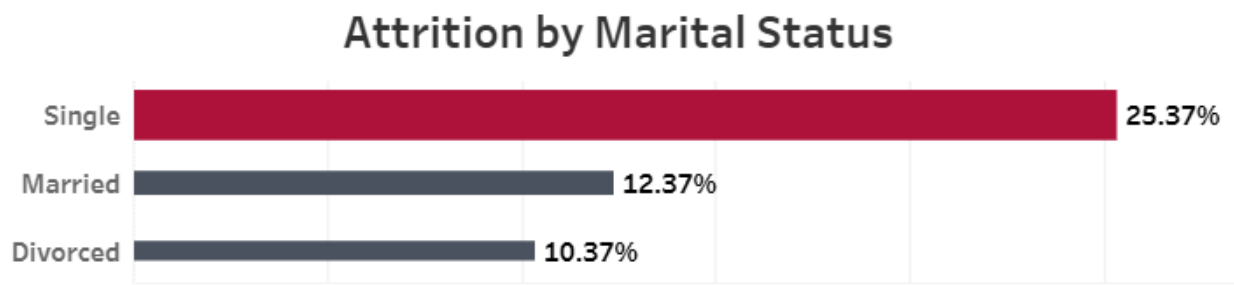
This is natural attrition, not something to "fix."

Overall Insight:

Attrition is:

- **Very high at entry level**
- **Lowest at mid-career**
- **Rises again near retirement**

But the real issue is sharply concentrated in early careers, losing young talents.



3- Are single or married or divorced employees more likely to leave the company?

The data shows a very clear correlation between personal life stage and employee retention.

Single Employees (25.37% highest risk)

- **More flexible, fewer obligations → easier to switch jobs**
- **More likely to explore opportunities, relocate, or change careers**
- **Lower "switching cost" (no family/financial anchors)**

High attrition here is expected. This group is inherently mobile, not necessarily dissatisfied.

Married Employees (12.37% stable)

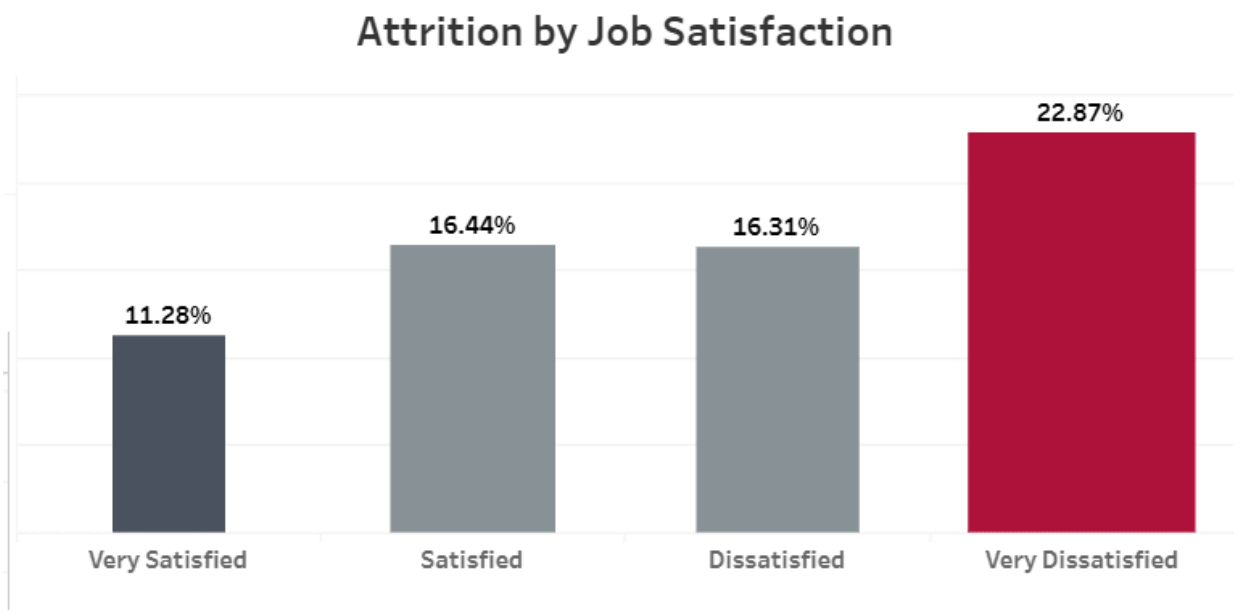
- **Financial and family responsibilities increase the cost of leaving**
- **Preference for stability over risk**
- **Less likely to move unless there is a strong incentive**

Marriage acts as a retention anchor.

Divorced Employees (10.37% most stable)

- **Lowest attrition suggests even stronger stability behavior**
- **Likely prioritizing financial security and consistency**
- **Less risk-taking compared to single employees**

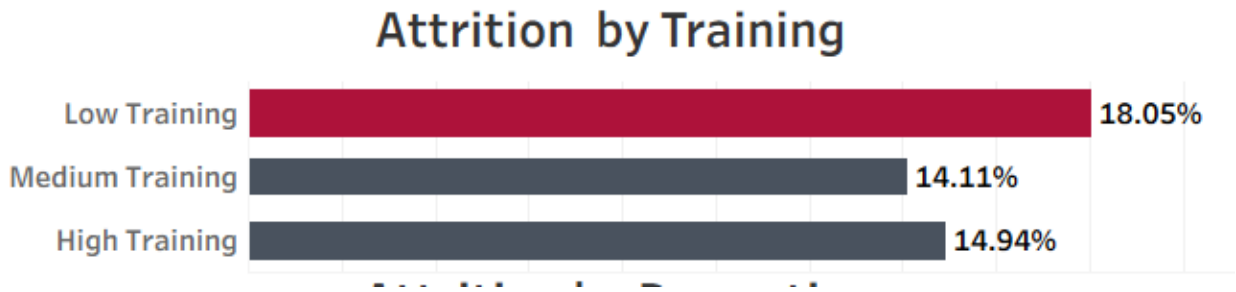
This group is the most retention-secure segment.



4- Analyze Attrition to Job Satisfaction

There is a massive jump in attrition once satisfaction drops to the lowest level.

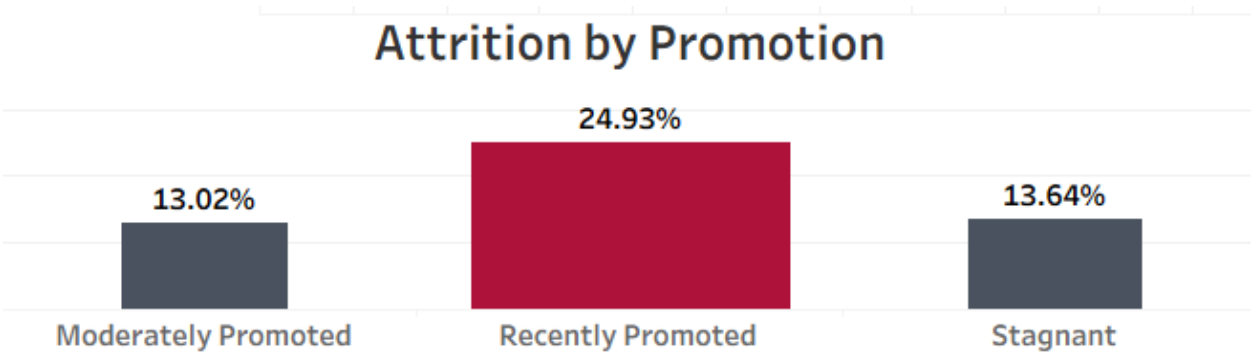
- **The Threshold: Employees who are "Dissatisfied," "Satisfied," or "Very Satisfied" all hover around an 11%–16% attrition rate.**
- **The Red Zone: Once an employee hits "Very Dissatisfied," the attrition rate spikes to 22.87%.**
- **Insight: Satisfaction is not a "sliding scale" for retention; rather, there is a "danger zone" at the bottom. The company doesn't necessarily need everyone to be "Very Satisfied" to keep them, but it must prevent them from falling into "Very Dissatisfied."**



5- Analyze Attrition to Training

- **Low Training: High attrition (18.05%).**
- **Medium Training: Lowest attrition (14.11%).**
- **High Training: Moderate attrition (14.94%).**

Moving from low to moderate training significantly reduces attrition. This indicates that lack of training is a key risk factor for employee turnover.



6- Analyze Attrition to Training

The "Unmet Expectation" Paradox

This is the most surprising data point in the report.

- **The Counter-Intuitive Stat: Employees who were "Recently Promoted" have the highest attrition (24.93%).**

- **The Comparison: Those who are "Stagnant" (not promoted) leave at only 13.64%.**

<u>This often happens for two reasons:</u>

1. **External Marketability:**

   A fresh promotion makes an employee's resume more attractive to recruiters.

2. **Role Burnout:**

   The "Recently Promoted" group might be struggling with increased workload or lack of support in their new, higher-pressure roles.

Recommendations:

Prioritize Entry-Level Retention: **Implement a structured mentorship and onboarding program specifically targeting the 18–25 age group, where attrition is currently at a critical high.**

Address Female Early-Career Support: **Launch specific inclusion and support initiatives for young female employees to counteract the 41.86% "red flag" attrition rate in that demographic.**

Restructure Frontline Revenue Roles: **Review the workload, pressure, and compensation models for Sales Representatives to lower their industry-leading turnover rate of 39.29%.**

Invest Heavily in Training: **Standardize "High Training" pathways across the company, as employees with more training are nearly twice as likely to stay compared to those with "Low Training".**

Implement Post-Promotion Support: **Provide resources and transition coaching for recently promoted staff to lower their 22.67% attrition rate and protect the company's investment in leadership.**

Monitor Satisfaction Thresholds: **Use pulse surveys to identify employees falling into the "Very Dissatisfied" category, as this specific group sees a massive spike in turnover to 22.87%.**

Leverage Demographic Stability: **Design benefits that appeal to Married and Divorced employees, who represent the most stable segments of the workforce with attrition rates as low as 10.37%.**

Incentivize Mid-Career Longevity: **Maintain the healthy retention seen in the 26–55 age range by ensuring competitive market pay, especially for males who are currently more likely to switch jobs for better opportunities.**
